Getting Started

This page contains step by step tutorials to get you started with installing and running the Bronze Release features.

SMO Installation

The goal of this tutorial is to install and run the Service Management Orchestrator

Near Realtime RIC Installation

The goal of this tutorial is to install and run the Near Realtime RIC

Hello World xApp Use Case Flows

This is a step by step tutorial to on-board, deploy and run a Hello World xApp in a Near Realtime RAN Intelligent Controller (RIC) instance.

How to onboard, deploy and run a Hello World xApp on RIC Video (18 minutes)

Running A1 and O1 Use Case Flows

The goal of this tutorial is to run the A1 and O1 interfaces

Figure 1: Demo deployment architecture

Bronze Demonstrations

Deployment

Minimum deployment for running Bronze use case demos.

SMO Cluster:

- ONAP "Lite" (Minimalistic for running SDNC/SDNR for RSAC Bronze O1)
  - Minimum replicas
  - VES collector is deployed standalone in ricaux namespace (w/o rest of DCAE, using a helm chart derived from the ONAP VES Cloudify Blueprint)
- Non RT RIC

Near RT RIC Cluster:

- Near RT RIC Platform
- Near RT RIC Applications

Videos

- Hello World xApp on-boarding, deployment, and policy distribution: xapp-hw.mp4
- A1 flow: a1.mp4
- O-DU HIGH - NearRTRic E2 setup: odu-high.mp4
- O1 flow: o1.mp4

O-RAN Alliance Components Definition

For the purposes of the present document, the terms and definitions given in 3GPP TR 21.905 [1] and the following apply. A term defined in the present document takes precedence over the definition of the same term, if any, in 3GPP TR 21.905 [1].
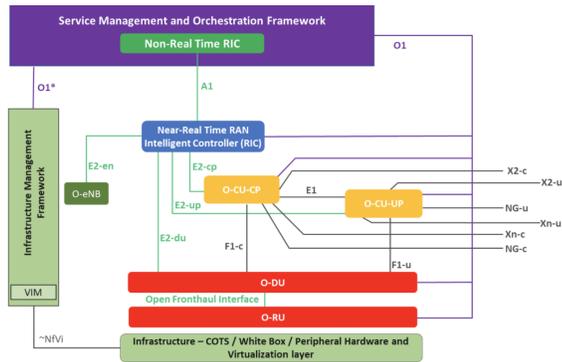

Figure 2: O-RAN architecture overview

In the O-RAN architecture, the radio side includes Near-RT RIC, O-CU-CP, O-CU-UP, O-DU, and O-RU. The management side includes Service Management and Orchestration Framework that contains a Non-RT-RIC function.

near-RT RIC: O-RAN near-real-time RAN Intelligent Controller: a logical function that enables near-real-time control and optimization of O-RAN elements and resources via fine-grained data collection and actions over E2 interface.

non-RT RIC: O-RAN non-real-time RAN Intelligent Controller: a logical function that enables non-real-time control and optimization of RAN elements and resources, AI/ML workflow including model training and updates, and policy-based guidance of applications/features in near-RT RIC.

NMS: A Network Management System

O-CU: O-RAN Central Unit: a logical node hosting RRC, SDAP and PDCP protocols

O-CU-CP: O-RAN Central Unit – Control Plane: a logical node hosting the RRC and the control plane part of the PDCP protocol

O-CU-UP: O-RAN Central Unit – User Plane: a logical node hosting the user plane part of the PDCP protocol and the SDAP protocol

O-DU: O-RAN Distributed Unit: a logical node hosting RLC/MAC/High-PHY layers based on a lower layer functional split.

O-RU: O-RAN Radio Unit: a logical node hosting Low-PHY layer and RF processing based on a lower layer functional split. This is similar to 3GPP's "TRP" or "RRH" but more specific in including the Low-PHY layer (FFT/iFFT, PRACH extraction).

O1: Interface between management entities in Service Management and Orchestration Framework and O-RAN managed elements, for operation and management, by which FCAPS management, Software management, File management shall be achieved.

O1*: Interface between Service Management and Orchestration Framework and Infrastructure Management Framework supporting O-RAN virtual network functions.

xAPP: Independent software plug-in to the Near-RT RIC platform to provide functional extensibility to the RAN by third parties.
